PRODUCT DESCRIPTION AND USE

Poly HD VOC is a two component, high solids aliphatic polyurethane formulated to comply with California VOC regulations. This product offers a remarkable combination of performance properties not found in other polymer coatings. Poly 100 VOC produces protective films which are hard, flexible and very impact resistant. These coatings feature high abrasion and scratch resistance, exterior durability, easy soil release and excellent resistance to a broad range of chemicals. For exterior applications, a UV stabilizer package is incorporated to ensure long term chalk resistance and gloss retention. A special accelerator is available when rapid project turnaround is required.

Poly HD VOC has been designed as a high performance top coat in various protective coating and seamless flooring applications. It provides maximum cleanability and stain resistance when used as a finish coat in color chip flooring or epoxy-quartz flooring. This coating is ideally suited for clean-room floors, automotive repair facilities, aircraft hangars and other high wear areas requiring resistance to fuels and chemicals. When used as a finish coat in wall coating systems, anti-graffiti properties are greatly enhanced.

Chemical Composition
Polyester polyol cross linked with aliphatic polyisocyanate.

Limitations
- Do not use on unprimed substrate.
- Use of satin material requires the addition of accelerator during mixing.

TECHNICAL DATA

Physical Properties
Mixing Ratio, by Volume......................................................................................................2-1
Solids Content, by Weight (Pigmented)...........................................................................62%
Solids Content, by Volume (Pigmented)...........................................................................59%
Solids Content, by Weight (Clear)..................................................................................60%
Solids Content, by Volume (Clear)..................................................................................54%
V.O.C.................................................................................................................................100grams/liter
Viscosity, cps (77 degrees)..............................................................................................500average
Pot Life (77 degrees, 1 quart mass).................................................................................2hours
Pot Life (95 degrees, 1 quart mass)..................................................................................1hour
  Pot Life is reduced by increasing temperature and/or mass

Physical Properties (Cont’d)
Dry Times (77 degrees)
Dry to Touch..................................................................................................................4-6hours
Recoat...........................................................................................................................10-12hours
Light Traffic....................................................................................................................24hours
Full Cure........................................................................................................................7days
Higher temperatures will shorten cure time and lower temperatures will lengthen cure time.
## Performance Properties
- Gloss (60 degrees): 90-95
- Gloss (satin material, 60 degrees): 50-60
- Hardness (Konig): 122
- Tabor Abrasion (1000 gm. Load 1000 cycles, CS 17 wheel): 38 mg. loss
- Flexibility (ASTM D-222): passes 1/8 inch
- Impact Resistance (ASTM D-2794): passes 120 inch-pound direct and reverse

## CHEMICAL AND STAIN RESISTANCE (ASTM D-1308 24 HOUR IMMERSION)

*Exposures longer than 72 hours will soften the coating film

## GENERAL INFORMATION

### Moisture Vapor Emissions Precautions

All interior concrete floors not poured over an effective moisture vapor retarder are subject to possible moisture vapor transmission that may lead to blistering and failure of the coating system. It is the coating applicator's responsibility to conduct calcium chloride and relative humidity probe testing to determine if excessive levels of vapor emissions are present before applying any coatings. Duracorp and/or Proline and its sales agents will not be responsible for coating failures due to undetected moisture vapor emissions.

### Surface Preparation

Poly HD VOC is intended to be applied over primed or previously coated surfaces. Do not apply directly to concrete. Surface must be absolutely clean, dry and free from all dirt, wax, oil, chalk, incompatible paint or detergent film. Fully cured, previously coated surfaces must be cleaned and sanded lightly with 80-100 grits and paper or otherwise mechanically abraded before recoating. If multiple coats of Poly HD VOC are applied, apply additional coats as soon as possible. If more than 24 hours has elapsed or the coating cannot be indented with a fingernail, lightly sand surface to ensure intercoat adhesion.
Mixing Instructions
Mix only that amount of material that can be used in a 2 hour period at 77°F. Higher temperatures and the addition of
accelerator will reduce work time. In hot weather, mix smaller batches. If using the pigmented system, premix part A well
before adding part B. Combining ratio is 2 parts A to 1 part B. Proportion the amounts carefully and mix for two full
minutes using as low speed drill, scraping the bottom and sides of the mixing container. Material is normally ap-
plied as received, but may be thinned with up to 15% solvent. Always thin the satin material to achieve a low application
viscosity. When thinning in California, the compliant solvents acetone and PCBTF must be used. In hot weather,
PCBTF is preferred due to its slower evaporation rate. In non-California use, check local regulations for approved sol-
vents. Avoid contamination with moisture. Reseal partially used containers completely after use.

Application Recommendations
Poly HD VOC may be applied by brush, roller or airless sprayer. Apply at 275-350 sq. ft. per gallon with 3/8" or 1/2" nap
roller as a finish coat over primed concrete. May be applied up to 200 sq. ft. per gallon as a fill coat in aggregate-filled
flooring systems using a rubber squeegee and back rolling with a 3/8" nap roller. If using the satin version of this mate-
rual, it is very important to achieve a uniform application rate of 300-350 sq. ft. per gallon. Heavier films will be glossier,
thinner applications will be flatter.

Handling Precautions
Material is flammable. Extinguish all flames, pilot lights and electric motors until all vapors are gone and the coating is
hard. The vapor is harmful. Use only with adequate ventilation/or appropriate cartridge-type respirator. Avoid contact
with skin; wear protective gloves. Read Material Safety Data Sheet before using.

Slip and Fall Precautions
OSHA and the American Disabilities Act (ADA) have now set enforceable standards for slip-resistance on
pedestrian surfaces. The current coefficient of friction required by ADA is .6 on level surfaces and .8 on
ramps. Duracorp and/or Proline recommends the use of angular slip-resistant aggregate in all coatings or
flooring systems that may be exposed to wet, oily or greasy conditions. It is the contractor and end users’
responsibility to provide a flooring system that meets current safety standards. Duracorp and/or Proline or its
sales agents will not be responsible for injury incurred in a slip and fall accident.
